

The Complete Video Production Guide

"I Analyzed 2,280 Premier League Matches — Here's What I Found"

Style: DaniDevStuff (fast cuts, code-focused, casual narration)

Length: 10-15 minutes

Platform: YouTube

Channel: Kennedy Mwangi — Data Analytics

READ THIS FIRST

Don't get paralyzed by perfection. **A good video shipped beats a perfect video unfinished.** Your first video will not be perfect. Your goal: ship something good enough that you'd watch it yourself. Iterate from there.

Realistic timeline:

- Setup + practice: 2-3 hours
- Recording: 3-4 hours (with retakes)
- Editing: 4-6 hours
- **Total: 1-2 days of focused work**

You can do this over a weekend without sacrificing your bootcamp prep.

PART 1: TOOLS & SETUP (1 hour)

Software Stack (All Free)

Screen Recording: OBS Studio ★

Why: Industry standard, free forever, no watermarks, no time limits, full control.

Download: <https://obsproject.com/>

Quick setup:

1. Install OBS Studio
2. On first launch, choose "Optimize for recording, I will not be streaming"
3. Let it auto-configure based on your hardware

Video Editor: DaVinci Resolve (Free) ★

Why: Hollywood-grade editor, completely free, learning curve is fair but rewarding.

Download: <https://www.blackmagicdesign.com/products/davinciresolve>

Alternative if Resolve is too heavy: Clipchamp (built into Windows 10/11 — search for it in Start menu). Simpler, web-based, perfectly fine for first video.

Audio Recording: Audacity (Free)

Why: Clean voice recording, noise removal, free forever.

Download: <https://www.audacityteam.org/>

Alternative: Record audio directly in OBS — saves a step.

Background Music: Free Sources

- **YouTube Audio Library** (<https://youtube.com/audiolibrary>) — no copyright strikes
- **Lofi Girl** on YouTube — search "lofi study music no copyright"
- **Pixabay Music** (<https://pixabay.com/music/>) — fully free

Genre: Lofi hip-hop, chill synthwave, or downtempo electronic. Match DaniDev's vibe.

Thumbnail Design: Canva (Free)

Why: Pre-built YouTube thumbnail templates, easy to use.

Pro tip: Search "minimalist YouTube thumbnail" templates — code-focused channels use clean designs.

Hardware (What You Already Have Is Fine)

Item	What You Need	Notes
Microphone	Your laptop's built-in mic	OK for first video — upgrade later if it takes off
Headphones	Any pair to monitor audio	Wired is better (no Bluetooth lag)
Webcam	Built-in laptop webcam	OPTIONAL — see "talking head" decision below
Quiet room	Close door, turn off fan	Most important hardware decision

Upgrade priority later (when video #5 goes viral):

- 1. USB microphone (Blue Yeti Nano, ~\$80) — biggest quality jump
- 2. Better lighting (a ring light, ~\$30) — only if you decide on talking head
- 3. Webcam (Logitech C920, ~\$70) — only if you want HD talking head

For first video: **don't upgrade.** Ship with what you have.

The "Talking Head" Decision

Do you appear on camera in this video?

Yes (DaniDev does this small)	No (Pure code/screen only)
✔ Builds personal brand faster	✔ Easier to record
✔ Builds trust	✔ No webcam setup
✔ More LinkedIn-shareable	✔ Don't need to look great
✗ Need decent lighting	✗ Less personal connection
✗ More edits to manage	✗ Slower brand building

My recommendation for you: Small webcam in bottom-right corner, like DaniDev. People want to see the human behind the analysis. Your Kenyan-developer-going-global story is compelling — show your face.

If you're shy about this on Video #1: **just do voice-only this time.** You can add face later.

 PART 2: PRE-PRODUCTION (2-3 hours)

Your Video Concept

Working title: "I Analyzed 2,280 Premier League Matches With SQL — Here's What I Found"

Hook (first 15 seconds):

"Manchester City won the league. Everyone knows that. But what if I told you that during COVID, when stadiums were empty, home advantage in the Premier League DROPPED by 50%? I just spent a week analyzing six seasons of Premier League data, and the patterns I found are wild. Let me show you."

Why this hook works:

- Specific number (50%) creates curiosity
 - COVID angle is fresh and relevant
 - Promises pattern reveals = viewers stay
-

The Structure (10-15 Minute Video)

Section 1: Hook + Intro (0:00 - 1:30)

- **0:00-0:15** — The COVID hook (above)
- **0:15-0:45** — "I'm Kennedy, I'm teaching myself data analytics. This is project 1 of my portfolio."
- **0:45-1:30** — "Here's what I'm going to show you in this video: [list 3 specific findings]"

Section 2: The Setup (1:30 - 3:00)

- Show your data: "I downloaded 6 CSV files from football-data.co.uk"
- Show DBEaver: "Imported into SQLite. 2,280 matches total."
- Quick SELECT * to show the data live
- **PURPOSE:** Establishes you have real data, not toy examples

Section 3: Finding #1 — League Table Reconstruction (3:00 - 5:00)

- "First, I wanted to make sure my data was right. So I rebuilt the actual Premier League table from match data."
- Show the query (with explanatory voiceover)
- Run it → show result
- "Look: Man City at top, 91 points. That matches what fans saw. So my data's correct."
- **PURPOSE:** Proves credibility before bigger claims

Section 4: Finding #2 — Home Advantage Quantified (5:00 - 8:00)

- "Now the real fun. Is home advantage real?"
- Run Q2.1 query: "Across 2,280 matches: home teams win 44% of the time. Away teams win only 30%."
- Visualize this (bar chart in your notebook or just emphasize the numbers)
- "But here's where it gets interesting..."
- **TRANSITION TO COVID**

Section 5: The COVID Discovery (8:00 - 10:30) ★ MAIN STORY

- "During the 2020-21 season, COVID forced stadiums to be empty. What happened to home advantage?"
- Run Q2.4 (per-year breakdown)
- "Look at 2020 and 2021. The home advantage gap dropped from 14% to about 6%."
- Pause, let viewers process
- "That's a 50% reduction. **Proof — actual numerical proof — that crowds matter.**"
- "This is the kind of insight that turns 'football intuition' into 'data-driven decision making'."

Section 6: Bonus Findings (10:30 - 13:00)

- Quick montage of other findings:
- Win streaks (window function reveal!)
- Biggest upsets (top 3 with dates)
- Big 6 consistency analysis
- Each one gets ~30 seconds — fast pacing

Section 7: The Tech Stack (13:00 - 14:00)

- Quick mention: "All of this is SQL — no Python, no machine learning, just queries."
- Show your VS Code with the project structure

- "Full code is on GitHub — link in description."

Section 8: Outro + CTA (14:00 - 15:00)

- "If you're learning data analytics: real projects > tutorials. Pick a dataset you actually care about."
- "I'm documenting this whole journey on LinkedIn — Kennedy Mwangi."
- "If you have a sport or dataset you want me to analyze next, comment below."
- "Subscribe if you want to see more of this."

The Script (Write This Down)

Don't memorize. Write **bullet points** for each section, then talk naturally. Memorizing makes you sound robotic.

Example for the COVID section:

```
[COVID FINDING]
- Start: "Now this is where it gets wild..."
- Show 2020-21 row in Q2.4 result
- Numbers: 14% gap → 6% gap → back to 14%
- The reveal: "Empty stadiums removed half of home advantage"
- Pause for emphasis
- Implication: "Crowds aren't just atmosphere — they're a measurable competitive force"
```

That's it. Six bullet points = 90 seconds of natural narration.

Pre-Recording Checklist

Print this. Check each box before hitting record:

- ☐ Project folder open in VS Code (looks professional)
- ☐ DBeaver open with Chinook database connected
- ☐ All 7 SQL files saved and queries ready to run
- ☐ FINDINGS.md open in another tab for reference
- ☐ Phone in another room (or silent + face down)
- ☐ Door closed, quiet environment
- ☐ Water nearby (you'll need it after 30 min of talking)
- ☐ OBS Studio configured (test recording!)
- ☐ Webcam on (if using) and positioned well
- ☐ Audio test recording (listen back — clear?)
- ☐ Bullet point script visible (sticky note on side of screen)

🛠️ PART 3: PRODUCTION (3-4 hours)

OBS Studio Setup (15 min)

Initial Configuration

1. Open OBS Studio
2. **Settings → Output:**
 - Recording Path: `C:\Users\user\Documents\moringa-prep\video-files\` (create this folder)
 - Recording Quality: **High Quality, Medium File Size**
 - Recording Format: **MKV** (safer than MP4 — recovers if OBS crashes)
3. **Settings → Video:**

- Base Resolution: **1920x1080**
 - Output Resolution: **1920x1080**
 - FPS: **30** (60 if your laptop can handle it — looks smoother)
4. **Settings → Audio:**
- Sample Rate: 48 kHz
 - Mic/Auxiliary: Your microphone
 - Desktop Audio: Default (catches system sounds — turn off if you don't want them)

Scene Setup

Create ONE scene with these sources (bottom of OBS):

1. **Display Capture** (your monitor)
2. **Audio Input Capture** (your mic)
3. **Webcam (Video Capture Device)** — if doing talking head
 - Resize to small circle in bottom-right corner
 - Crop it square in OBS

Test Recording

1. Click **Start Recording**
2. Talk for 30 seconds, click around your screen
3. Click **Stop Recording**
4. Open the file from your recording folder
5. **Listen carefully** — is audio clear? Background noise?
6. **Watch carefully** — is screen capture clean? Anything cut off?

If yes → you're ready. If no → fix the issue before doing the real take.

Recording Strategy

Record in Sections (Not One Take)

Don't try to record the whole video in one go. It'll burn you out and you'll hate the result.

Record in **8 separate clips** matching your 8 sections. Each clip is 1-3 minutes. If you mess up:

- Stop talking, count to 3
- Start the sentence over
- That pause becomes an edit point in post

Recording Tips

Pacing:

- Talk slightly faster than feels normal — editing speeds things up further
- Pause briefly between thoughts (gives editing flexibility)
- Don't um/ah — silence is better

Energy:

- Smile while talking (you can hear it in your voice)
- Stand up if you can — energy comes through
- Drink water between sections

Code Demos:

- Pre-write all your queries before recording
- When showing a query: "Let's look at this..." → click cursor in editor → "This is doing X..."
- Run the query → wait for results → react: "Look at this!"

The Reaction Shots:

- When you discover something cool (like the COVID effect): **be authentic**
 - "Wait, what?" or "That's actually wild" sells the moment
 - Fake enthusiasm reads as fake — let yourself genuinely react
-

Common Recording Mistakes To Avoid

✗ Don't	✓ Do
Read straight from script	Use bullet points, talk freely
Show every query line-by-line	Show key parts, gloss over boilerplate
Speak in monotone	Vary tone — up for excitement, down for emphasis
Have YouTube ads playing in background	Mute everything
Show personal info on screen	Check tabs, file paths, anything visible
Record at midnight	Record when energy is HIGH

✂ PART 4: POST-PRODUCTION (4-6 hours)

DaVinci Resolve Quick Start (90 min to learn)

Step 1: Create Project

1. Open DaVinci Resolve → New Project → name it "PL Analysis Video"
2. Set Project Settings (gear icon, bottom right):
 - Timeline resolution: 1920x1080
 - Frame rate: 30 fps (match your OBS setting)

Step 2: Import Footage

1. Drag all your .mkv recording files into the Media Pool (left side)
2. Drag your background music into the Media Pool
3. Click **Edit** tab at bottom

Step 3: Build The Timeline

1. Drag your first video clip onto the timeline (bottom)
2. Drag your second clip after it
3. Trim out the awkward starts/stops (click the clip edges and drag)
4. Add background music: drag music file to audio track 2
5. Right-click the music → Set audio level to about -25dB (background)

Step 4: Add Captions (CRITICAL FOR YOUTUBE)

DaVinci Resolve has a "Subtitles" feature:

1. Click the **Subtitles** track icon
2. Right-click → "Create Subtitles from Audio"
3. Wait while it transcribes (about 5 min for 15-min video)
4. Review and edit — fix any mistakes

Why captions matter: 80% of social video is watched on mute. Captions = 3x more retention.

Step 5: Add B-Roll And Cuts

This is where DaniDev style happens:

- **Whenever you say "look at this"** → cut to the screen showing it
- **Whenever you say "let me show you"** → cut to your editor
- **Long pauses** → cut them out entirely

The rhythm: **change shot every 3-5 seconds.**

Step 6: Color And Polish

- Click **Color** tab (bottom) — auto-balance your colors
- Click **Fairlight** tab — clean up audio:
- Add "Voice Isolation" effect to your mic track (free in newer versions)
- Apply mild compression

Step 7: Export

1. Click **Deliver** tab (bottom right)
2. Preset: **YouTube 1080p**
3. Set destination folder
4. Click **Add to Render Queue**
5. Click **Render All**
6. Wait 20-60 min depending on length

Or — The Easier Alternative: Clipchamp

If DaVinci Resolve feels overwhelming for video #1:

1. Open Windows Start menu → search "Clipchamp"
2. New project → import your OBS recordings
3. Drag clips onto timeline
4. Trim, add music, add text overlays
5. Click "Auto-captions" — built into Clipchamp
6. Export → 1080p

Clipchamp is way easier but less powerful. Perfectly fine for first video.

PART 5: PUBLISHING

YouTube Setup Checklist

Channel Setup (One Time)

- [] Create YouTube channel under your real name: "Kennedy Mwangi"
- [] Channel banner: same style as your LinkedIn (Canva can do this)
- [] Channel description: "Data analytics journey from Kenya. SQL, Python, real projects."
- [] Profile picture: same as LinkedIn/Twitter (consistency!)

Per-Video Settings

Title (most important):

- ★ "I Analyzed 2,280 Premier League Matches With SQL — Here's What I Found"
- Alternative: "What 6 Seasons of Premier League Data Taught Me About Football"
- Alternative: "The COVID Premier League Discovery (SQL Analysis)"

Description template:

What happens when you analyze 6 seasons of Premier League data with SQL?
I just spent a week doing exactly that.

🔍 What's in this video:

0:00 Intro
1:30 The data setup
3:00 Rebuilding the Premier League table from scratch
5:00 Quantifying home advantage
8:00 The COVID empty-stadium discovery
10:30 Win streaks + biggest upsets
13:00 The tech stack
14:00 What I'm building next

🛠️ Tools used:

- SQL (SQLite)
- DBeaver
- VS Code
- football-data.co.uk dataset

🔗 Links:

- Full code on GitHub: github.com/kennmwangi/moringa-prep
- LinkedIn: [your URL]

I'm Kennedy, learning data analytics out loud. This is portfolio project #1 of my journey. New videos every [weekly/monthly].

#DataAnalytics #SQL #PremierLeague #SportsAnalytics

Tags: data analytics, SQL, Premier League, sports analytics, data science portfolio, learn SQL, SQL tutorial, beginner SQL project

Thumbnail (3 minutes in Canva):

- 1280x720 pixels
- Big text: "PREMIER LEAGUE x SQL"
- Your face (small) + a striking stat ("HOME ADVANTAGE DROPPED 50%")
- Bold colors — yellow and blue contrast well

Visibility: Public

Premiere: Optional — schedules it like a movie premiere (creates buzz)

Comments: Allow (recruiters DM through comments sometimes)

Post-Publishing Promotion

Day 1 (Launch Day)

- ✓ Post on LinkedIn with thumbnail + key insight (the COVID one)
- ✓ Post on Twitter/X with the COVID stat as the hook
- ✓ Share in r/dataanalysis (read their rules first — don't get banned)
- ✓ DM 5 connections personally: "Hey, I made my first portfolio video..."

Week 1

- Reply to EVERY comment within 24 hours (YouTube algorithm loves engagement)
- Pin your best comment (or pin your own with a key insight)
- Track views — first 100 are hardest, momentum matters

Long-term

- Don't measure success in subscribers. Measure in:
- Recruiter messages from LinkedIn
- DMs about freelance opportunities
- Comments asking technical questions

Goal of video #1: Land 1-3 conversations with hiring managers or potential clients. That's the real KPI.

💡 PART 6: THE LINKEDIN POST (DAY OF LAUNCH)

When the video goes live, post this on LinkedIn:

Just published my first data analytics video on YouTube 📺

The hook: During the 2020-21 COVID Premier League season — when stadiums were empty — home advantage DROPPED by 50%.

I analyzed 2,280 matches across 6 seasons using SQL to find out why.

What you'll see in 15 minutes:

- ✓ Rebuilding the Premier League table from raw match data
- ✓ Quantifying home advantage (it's measurably real)
- ✓ The COVID discovery — empty stadiums changed everything
- ✓ Win streaks via window functions
- ✓ Biggest upsets in modern PL history

This is portfolio project #1 of my data analytics journey.

Why I made the video version: data analysis is storytelling. Anyone can write SQL. The skill is finding the story IN the numbers.

🔗 Watch here → [YouTube link]

📄 Code on GitHub → github.com/kennmwangi/moringa-prep

If you've worked with sports data — or want to suggest a dataset for my next project — drop a comment.

#DataAnalytics #SQL #PremierLeague #LearningInPublic #YouTube

Pin this post.

🎯 PART 7: REALISTIC EXPECTATIONS

Honest Numbers For Video #1

Metric	Likely Range	What It Means
Views (first week)	50-300	Normal — most don't watch yet
Subscribers gained	5-30	Quality > quantity
LinkedIn shares of video	5-15	This is where ROI lives
Recruiter DMs	1-5	THE actual goal
Freelance inquiries	0-3	Possible from this video alone

The first video is a learning exercise more than a viral attempt. Video #5-10 is where things click.

What Success Actually Looks Like

- ✗ NOT: 10K views, 1K subscribers
- ✓ YES: 1 recruiter DM saying "love your work"
- ✓ YES: 3 LinkedIn connections from "great video"
- ✓ YES: 1 fellow learner asking for help with their project

✓ YES: You're more confident publishing your next one

YOUR PRODUCTION SCHEDULE

Realistic Timeline (2-3 days of focused work)

Day A (Saturday, 4 hours)

- Hour 1: Install OBS, DaVinci Resolve, set up
- Hour 2: Write bullet-point script for all 8 sections
- Hour 3: Practice run-through (no recording, just talking through)
- Hour 4: Record sections 1-4

Day B (Sunday, 4 hours)

- Hour 1: Record sections 5-8
- Hour 2: Import to DaVinci Resolve, rough cut
- Hour 3: Add captions, music
- Hour 4: Polish, export

Day C (Monday, 2 hours)

- Hour 1: Create thumbnail, upload to YouTube
- Hour 2: Write LinkedIn/Twitter posts, schedule

Total: ~10 hours over a weekend. That's IT.

IF YOU GET STUCK

Common Problems

"I sound weird in recordings"

Reality: Everyone hates their own voice. Yours sounds normal to viewers. Push through.

"My code is wrong/buggy on camera"

Reality: Editing fixes everything. Stop, take 3 breaths, start the sentence over.

"DaVinci Resolve crashes"

Reality: Switch to Clipchamp. Don't fight the tool. Ship the video.

"The video isn't perfect"

Reality: Yours won't be Video #1 of MKBHD. That's fine. **Done > perfect.**

"I'm too tired"

Reality: Spread it over a week. Record one section per day. Pace yourself.

FINAL THOUGHT

A polished video about your Premier League SQL analysis could be the single piece of content that:

- Lands your first freelance gig
- Gets a recruiter to slide into your DMs
- Establishes you as "the SQL guy" in your network
- Becomes Video #1 in a content library that compounds over years

But **only if you ship it.**

The best video is the one you actually publish. Set a deadline — say, **Sunday at 8 PM** — and ship by then.

Even if it's not perfect. Especially if it's not perfect.

Go build it, Kennedy. 🏠🔧

📋 ONE-PAGE CHEAT SHEET

Task	Tool	Time
Screen record	OBS Studio	3-4 hrs
Edit	DaVinci Resolve (or Clipchamp)	4-6 hrs
Captions	DaVinci auto-captions	30 min
Music	YouTube Audio Library	15 min
Thumbnail	Canva	30 min
Upload	YouTube	30 min
Promote	LinkedIn + Twitter	30 min

Total: 10-13 hours over a weekend.

That's it. That's the whole video. **Go ship.**
